

Environmental Policy:

Action for Rural Advancement (ARA) is committed to restoring and protecting the environment through sustainable, community-driven initiatives that strengthen climate resilience and safeguard natural ecosystems. Recognizing the growing threats of climate change, environmental degradation, and pollution, ARA works closely with vulnerable communities to promote ecological restoration and sustainable resource management.

A key focus of ARA's environmental efforts is the strengthening of **mangrove reforestation programs** in coastal regions. Mangrove forests serve as natural barriers against cyclones, storm surges, coastal erosion, and saline intrusion while supporting biodiversity and local livelihoods. Through community-based plantation campaigns, awareness programs, and ecosystem conservation initiatives, ARA contributes to the restoration and protection of these vital coastal resources.

ARA also promotes **active community participation in reinforcing coastal embankments and dykes**, which are essential for protecting lives, agricultural land, and infrastructure from climate-induced disasters. By engaging local residents, community leaders, and relevant stakeholders, ARA supports the development of resilient and sustainable coastal protection systems that address local needs and vulnerabilities.

In addition, ARA develops and implements **community-based models for plastic pollution and waste management**. These initiatives focus on raising environmental awareness, encouraging waste reduction and recycling practices, improving waste collection systems, and fostering responsible consumption behaviors. Through capacity-building, advocacy, and community mobilization, ARA helps create cleaner and healthier living environments while reducing the environmental impacts of unmanaged waste.

Through these integrated environmental restoration and protection efforts, ARA contributes to building resilient communities, conserving natural ecosystems, and promoting sustainable development for present and future generations.
